

KRAL Screw Pumps.
Magnetic coupling.

Pumps

Challenging Task.

KRAL pumps with magnetic coupling are hermetically sealed and can handle temperatures to 300 °C.

Operation, materials and accessories.

Max. flow rates:	2,900 l/min.
Max. pressure:	100 bar.
Temperature range:	-40 °C to 300 °C.
Casing:	Nodular cast iron, silafont and steel.
Spindles:	Nitrated steel.
Energy density:	250 kJ/m ³ .
Magnet material:	Sm ₂ Co ₁₇ -permanent magnets.

Leakage-free and clean.

Critical liquid containing substances endangering the health or the environment should not leak to the atmosphere.

Conventional shaft seals are lubricated by the liquid. A leakage flow is specified and necessary for proper operation.

Magnetic couplings replace conventional shaft seals. KRAL pumps with magnetic coupling are hermetically sealed, the environment remains clean.

Can be used to 300 °C.

Thermal distortion and the temperature limits of elastomeric sealing elements restrict the use of screw pumps in high temperature applications.

If temperatures up to 300 °C are handled, KRAL pumps with magnetic coupling are the right choice.

Comparison of life cycle costs.

Reduced life cycle costs.

Spare parts and maintenance costs of mechanical seals increase life cycle costs.

The use of high quality mechanical seals in KRAL screw pumps is the standard. Even when properly applied, mechanical seals are subject to wear. Spare parts and maintenance costs arise.

KRAL magnetic couplings are maintenance free, due to the lack of a mechanical seal and increased life of the ball bearing. The cost premium of a pump with a magnetic coupling will be typically amortized after only three years of operation.

Protection of delivery medium.

With conventional seals, oxygen from the atmosphere may diffuse through the sealing gap into the liquid. When the liquid crystallizes from contact with oxygen, the process is interrupted and expensive plant shut downs can result.

KRAL pumps with magnetic coupling are hermetically sealed and protect the integrity of the liquid.

Low price.

A magnetic coupling is required to transmit high torques. This can make the magnetic coupling large and expensive.

For high torque transmission, strong magnets are necessary.

The new generation of KRAL pumps are cost optimized and designed to the requirements of the magnetic coupling. For many years, KRAL has successfully manufactured magnetic coupled pumps. Experiences and actual field tested applications were incorporated in the design.

Overload protection.

If the operating limits are exceeded, the pump may become damaged.

Solids in the liquid can lead to blockade and damage the spindle and the housing. In most cases the final manufactured product is not to specification, and the pump must be replaced. If the decoupling is controlled, and the pump stops, the pump and magnetic coupling will suffer no damage.

The magnetic coupling can prevent consequential damage.

Areas of application.

KRAL pumps with magnetic couplings are screw pumps for pumping fuels, oils and other non aggressive liquids. They are used primarily in industrial applications, such as:

- Marine, as circulation pumps for fuels. Plastics processing, especially polyurethane applications.
- Power plant engineering, as circulation pumps for fuels. Plant engineering and the chemical industry for heat transfer liquids.

■■■■■■■■ Pumps

KRAL Magnetic Coupling Pumps.

No more mechanical seal problems.

KRAL pumps are also available with magnetic seals. Magnetic coupled pumps from KRAL are maintenance free, hermetically sealed and can be used at temperatures of up to 300 °C. Additionally, the lifespan of the ball bearings is considerably extended.

Drive screw.

High inlet pressure acts directly on the surface of the main drive screw as well as

Balancing cylinder.

The balancing cylinder is precisely dimensioned so that the axial forces (F3 and F4) resulting from the pressures acting on its surfaces largely cancel each other out.

Magnetic coupling.

Thanks to an opening through the centre of the drive screw, the suction side pressure conditions are also present within the containment can of the magnetic coupling. Due to this special design, a force is created (F5) that compensates for the axial thrust on the main spindle. The load on the bearings is minimized leading to longer and more trouble-free operation.

High inlet pressure.

High inlet pressure can cause enormous load on the ball bearings as well as the mechanical seal.

A conventional pump with high inlet pressure requires expensive mechanical seal solutions, structural reinforcement and liquid channels for hydraulic balancing.

The magnetic coupling design eliminates the axial forces, resulting in only minimal load on the ball bearings due to the given conditions. The life expectancy of the ball bearings is thus independent of the inlet pressure, and the magnetic coupling replaces a costly mechanical seal. This means a better pump solution.

the idler screws (F1). Some of the force is compensated for on the pressure side of the main screw (F2), however the resulting axial force would normally create a high axial load on the bearings. This is not the case with a magnetic coupling.

Best material quality.

Highest quality materials can withstand high pressures and guarantee minimal eddy current losses at the magnetic coupling.

Technical Data.

Dimensions and weights.

Technical data, dimensions and weights apply for the series K. For higher pressures of up to 100 bar and flow rates up to 2,900 l/min please provide application information for the series L and C.

Technical data.		5-20	32-42	55-118	160-275	370-450	550-660	**

Practical Examples.

KRAL applications.

Photo: Krauss-Maffei Kunststofftechnik GmbH.

More safety for the Marine.

Medium: Heavy fuel oil (HFO).
Delivery rate: 50 l/min.
Pressure: Up to 8 bar.
Temperature: Up to 190 °C.
Viscosity: 3 to 760 mm²/s.

Diesel engines are used on board of offshore ships as the power plant and auxiliary engine. KRAL pumps deliver the fuel in the booster module, in this example heavy fuel oil.

Our customer, a large European ship owner with global establishments including the USA, has upgraded with the KRAL AG. For this upgrade pumps with mechanical seals have been changed to KRAL pumps with magnetic coupling. The reason for this upgrade was, to avoid the normal leakage of a mechanical seal. The leakage evident from lubricating the sealing faces can be a high fire risk. A magnetic coupling is hermetically sealed and leakage free.

High viscosity polyurethanes.

Medium: Polyol and isocyanate.
Delivery rate: 20 to 110 l/min.
Pressure: Up to 15 bar.
Temperature: Up to 190 °C.
Viscosity: 300 to 5,000 mm²/s.

Polyurethane is obtained when polyol and isocyanate is mixed, polyurethane is used in a wide variety of products including seat cushions and instrument panels.

KRAL pumps with magnetic couplings are hermetically sealed, this prevents the forming of carbamide crystals in PUR-machines.

The carbamide crystals may block the foaming facility's mixer casing and incorrect mixing formulation causes a faulty end product.

Hot fluids.

Medium: Pitch.
Delivery rate: 120 l/min.
Pressure: 8 bar.
Temperature: 110 to 220 °C.
Viscosity: 200 to 2,000 mm²/s.

For the manufacture of graphite components, pitch is used. Trucks deliver the bitumen heated, this allows the bitumen to be pumped or transferred. With screw pumps this pitch will be transferred out of the stock tank into a day tank. Due to the high temperature and sticky nature it can develop problems for standard seals.

To eliminate this problem, a well known graphite manufacturer is using KRAL screw pumps with magnetic coupling and heated jacketing. More examples for hot fluids are heat transfer oils and hot waxes.

Joint projects.

Our business partners are particularly appreciative of the cooperative collaboration with the KRAL AG. From the best possible support to the successful conclusion of the project, friendly business relations are always the order of the day. We take the time to talk to our customers and collaborate closely with them on technical matters. You can rely on KRAL.
